

重庆邮电大学线性代数习题册详解

第2章 矩阵及其运算

习题 2.1

1. 写出以矩阵 $\begin{pmatrix} 2 & 1 & 1 & -2 & 1 \\ 2 & -3 & 4 & 2 & 2 \\ 3 & -2 & 0 & 1 & 3 \\ 1 & 0 & 5 & -1 & 0 \end{pmatrix}$ 为增广矩阵的线性方程组.

$$\text{解} \begin{cases} 2x_1 + x_2 + x_3 - 2x_4 = 1, \\ 2x_1 - 3x_2 + 4x_3 + 2x_4 = 2, \\ 3x_1 - 2x_2 + x_4 = 3, \\ x_1 + 5x_3 - x_4 = 0. \end{cases}$$

习题 2.2

1. 设矩阵 $A = \begin{pmatrix} 1 & 2 & 3 \\ 2 & 4 & 1 \\ 3 & 2 & 4 \end{pmatrix}$, $B = \begin{pmatrix} 1 & 0 & 1 \\ -4 & 2 & 1 \\ 1 & -2 & 2 \end{pmatrix}$. 求矩阵 X , 使 $3A - 2X = B$.

$$\begin{aligned} \text{解 } X &= \frac{1}{2}(3A - B) = \frac{1}{2} \left(3 \begin{pmatrix} 1 & 2 & 3 \\ 2 & 4 & 1 \\ 3 & 2 & 4 \end{pmatrix} - \begin{pmatrix} 1 & 0 & 1 \\ -4 & 2 & 1 \\ 1 & -2 & 2 \end{pmatrix} \right) \\ &= \frac{1}{2} \begin{pmatrix} 2 & 6 & 8 \\ 10 & 10 & 2 \\ 8 & 8 & 10 \end{pmatrix} = \begin{pmatrix} 1 & 3 & 4 \\ 5 & 5 & 1 \\ 4 & 4 & 5 \end{pmatrix}. \end{aligned}$$

2. 计算

$$(1) \begin{pmatrix} 1 & -1 & 0 & 2 \\ -2 & 0 & 3 & 4 \end{pmatrix} \begin{pmatrix} 1 & 2 & -1 \\ 2 & 1 & -2 \\ 3 & 0 & 5 \\ 0 & 3 & 4 \end{pmatrix}; (2) (x_1, x_2, x_3) \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{12} & a_{22} & a_{23} \\ a_{13} & a_{23} & a_{33} \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix}.$$

$$\text{解 } (1) \begin{pmatrix} 1 & -1 & 0 & 2 \\ -2 & 0 & 3 & 4 \end{pmatrix} \begin{pmatrix} 1 & 2 & -1 \\ 2 & 1 & -2 \\ 3 & 0 & 5 \\ 0 & 3 & 4 \end{pmatrix} = \begin{pmatrix} -1 & 7 & 9 \\ 7 & 8 & 33 \end{pmatrix},$$

(2)

$$\begin{aligned} &(x_1, x_2, x_3) \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{12} & a_{22} & a_{23} \\ a_{13} & a_{23} & a_{33} \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} \\ &= (a_{11}x_1 + a_{12}x_2 + a_{13}x_3 \quad a_{12}x_1 + a_{22}x_2 + a_{23}x_3 \quad a_{13}x_1 + a_{23}x_2 + a_{33}x_3) \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} \\ &= a_{11}x_1^2 + a_{22}x_2^2 + a_{33}x_3^2 + 2a_{12}x_1x_2 + 2a_{13}x_1x_3 + 2a_{23}x_2x_3. \end{aligned}$$

3. 已知两个线性变换

$$\begin{cases} x_1 = 2y_1 + y_3, \\ x_2 = -2y_1 + 3y_2 + 2y_3, \\ x_3 = 4y_1 + y_2 + 5y_3 \end{cases}, \begin{cases} y_1 = -3z_1 + z_2, \\ y_2 = 2z_1 + z_3, \\ y_3 = -z_2 + 3z_3, \end{cases}$$

求从 z_1, z_2, z_3 到 x_1, x_2, x_3 的线性变换.

解 因已知两个线性变换的矩阵形式分别为

$$\begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 2 & 0 & 1 \\ -2 & 3 & 2 \\ 4 & 1 & 5 \end{pmatrix} \begin{pmatrix} y_1 \\ y_2 \\ y_3 \end{pmatrix}, \quad \begin{pmatrix} y_1 \\ y_2 \\ y_3 \end{pmatrix} = \begin{pmatrix} -3 & 1 & 0 \\ 2 & 0 & 1 \\ 0 & -1 & 3 \end{pmatrix} \begin{pmatrix} z_1 \\ z_2 \\ z_3 \end{pmatrix},$$

则从 z_1, z_2, z_3 到 x_1, x_2, x_3 的线性变换为

$$\begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 2 & 0 & 1 \\ -2 & 3 & 2 \\ 4 & 1 & 5 \end{pmatrix} \begin{pmatrix} -3 & 1 & 0 \\ 2 & 0 & 1 \\ 0 & -1 & 3 \end{pmatrix} \begin{pmatrix} z_1 \\ z_2 \\ z_3 \end{pmatrix} = \begin{pmatrix} -6 & 1 & 3 \\ 12 & -4 & 9 \\ -10 & -1 & 16 \end{pmatrix} \begin{pmatrix} z_1 \\ z_2 \\ z_3 \end{pmatrix},$$

$$\text{即 } \begin{cases} x_1 = -6z_1 + z_2 + 3z_3, \\ x_2 = 12z_1 - 4z_2 + 9z_3, \\ x_3 = -10z_1 - z_2 + 16z_3 \end{cases}.$$

4. 下列说法是否正确? 若正确, 请证明; 若错误, 请举出反例.

(1) 若 $A^2 = O$, 则 $A = O$;

(2) 若 $A^2 = A$, 则 $A = O$ 或 $A = E$;

(3) 若 $A^2 = E$, 则 $A = E$ 或 $A = -E$;

(4) 若 $AX = AY$, 且 A 可逆, 则 $X = Y$.

解 (1) 错误. 取 $A = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$, 有 $A^2 = O$, 但 $A \neq O$;

(2) 错误. 取 $A = \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}$, 有 $A^2 = A$, 但 $A \neq O$ 且 $A \neq E$;

(3) 错误. 取 $A = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$, 有 $A^2 = E$, 但 $A \neq E$ 且 $A \neq -E$;

(4) 正确. 因 A 可逆, 由 $AX = AY$, 有 $A^{-1}AX = A^{-1}AY$, 得 $X = Y$.

5. 设 $a = \begin{pmatrix} 2 \\ 1 \\ -3 \end{pmatrix}$, $b = \begin{pmatrix} 1 \\ 2 \\ 4 \end{pmatrix}$, $A = ab^T$, 求 A^{100} .

解 因 $A = ab^T = \begin{pmatrix} 2 \\ 1 \\ -3 \end{pmatrix} (1, 2, 4) = \begin{pmatrix} 2 & 4 & 8 \\ 1 & 2 & 4 \\ -3 & -6 & -12 \end{pmatrix}$, $b^T a = (1, 2, 4) \begin{pmatrix} 2 \\ 1 \\ -3 \end{pmatrix} = -8$,

$$A^2 = AA = a(b^T a)b^T = -8ab^T = -8A$$

于是 $A^{100} = ab^T ab^T \cdots ab^T = (-8)^{99} ab^T = -8^{99} A$.

6. 设 $A = \begin{pmatrix} k & 1 & 0 \\ 0 & k & 1 \\ 0 & 0 & k \end{pmatrix}$, 求 A^n (正整数 $n \geq 2$).

解 (法一: 数学归纳法) 当 $n = 2$ 时,

$$A^2 = \begin{pmatrix} k & 1 & 0 \\ 0 & k & 1 \\ 0 & 0 & k \end{pmatrix} \begin{pmatrix} k & 1 & 0 \\ 0 & k & 1 \\ 0 & 0 & k \end{pmatrix} = \begin{pmatrix} k^2 & 2k & 1 \\ 0 & k^2 & 2k \\ 0 & 0 & k^2 \end{pmatrix}.$$

假设

$$A^{n-1} = \begin{pmatrix} k^{n-1} & (n-1)k^{n-2} & \frac{(n-1)(n-2)}{2}k^{n-3} \\ 0 & k^{n-1} & (n-1)k^{n-2} \\ 0 & 0 & k^{n-1} \end{pmatrix},$$

成立, 则

$$\begin{aligned} A^n &= A^{n-1}A = \begin{pmatrix} k^{n-1} & (n-1)k^{n-2} & \frac{(n-1)(n-2)}{2}k^{n-3} \\ 0 & k^{n-1} & (n-1)k^{n-2} \\ 0 & 0 & k^{n-1} \end{pmatrix} \begin{pmatrix} k & 1 & 0 \\ 0 & k & 1 \\ 0 & 0 & k \end{pmatrix} \\ &= \begin{pmatrix} k^n & nk^{n-1} & \frac{n(n-1)}{2}k^{n-2} \\ 0 & k^n & nk^{n-1} \\ 0 & 0 & k^n \end{pmatrix} \end{aligned}$$

成立. 由数学归纳法可知

$$A^n = \begin{pmatrix} k^n & nk^{n-1} & \frac{n(n-1)}{2}k^{n-2} \\ 0 & k^n & nk^{n-1} \\ 0 & 0 & k^n \end{pmatrix}.$$

(法二)

$$\text{因 } A = k \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} + \begin{pmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{pmatrix} = kE + B,$$

其中 E 为三阶单位矩阵, $B = \begin{pmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{pmatrix}$,

$$\text{又 } B^2 = \begin{pmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 1 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix},$$

$$B^3 = B^2 B = \begin{pmatrix} 0 & 0 & 1 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} = O, \text{ 即 } B^n = O, n \geq 3.$$

于是

$$\begin{aligned} A^n &= (kE + B)^n = k^n E + nk^{n-1}B + \frac{n(n-1)}{2}k^{n-2}B^2 \\ &= k^n \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} + nk^{n-1} \begin{pmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{pmatrix} + \frac{n(n-1)}{2}k^{n-2} \begin{pmatrix} 0 & 0 & 1 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \\ &= \begin{pmatrix} k^n & nk^{n-1} & \frac{n(n-1)}{2}k^{n-2} \\ 0 & k^n & nk^{n-1} \\ 0 & 0 & k^n \end{pmatrix}, n \geq 2. \end{aligned}$$

7. 设矩阵 A, B 都是 n 阶对称矩阵, 证明 AB 是对称矩阵的充分必要条件是 A 与 B 可交换.

证明 因 $A^T = A, B^T = B$, $(AB)^T = AB$, 即 $B^T A^T = AB$, 所以 $BA = AB$, 即 A 与 B 可交换, 必要性得证.

反之, 因 A 与 B 可交换, 即 $BA = AB$, 又 $A^T = A, B^T = B$. 则 $B^T A^T = AB$, 即 $(AB)^T = AB$, 所以 AB 是对称矩阵, 充分性得证.

习题 2.3

1. 求下列矩阵的逆矩阵:

$$(1) \begin{pmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{pmatrix}; \quad (2) \begin{pmatrix} 1 & 2 & -1 \\ 3 & 4 & -2 \\ 5 & -4 & 1 \end{pmatrix}.$$

解 (1) 因 $|A| = \begin{vmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{vmatrix} = 1$,

$$A_{11} = \cos \theta, \quad A_{12} = -\sin \theta, \quad A_{21} = \sin \theta, \quad A_{22} = \cos \theta,$$

所以 $A^{-1} = \frac{1}{|A|} A^* = \begin{pmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{pmatrix}.$

(2) 因 $|A| = \begin{vmatrix} 1 & 2 & -1 \\ 3 & 4 & -2 \\ 5 & -4 & 1 \end{vmatrix} = \begin{vmatrix} 1 & 2 & -1 \\ 0 & -2 & 1 \\ 0 & -14 & 6 \end{vmatrix} = 2$

$$A_{11} = \begin{vmatrix} 4 & -2 \\ -4 & 1 \end{vmatrix} = -4, \quad A_{12} = -\begin{vmatrix} 3 & -2 \\ 5 & 1 \end{vmatrix} = -13, \quad A_{13} = \begin{vmatrix} 3 & 4 \\ 5 & -4 \end{vmatrix} = -32,$$

$$A_{21} = -\begin{vmatrix} 2 & -1 \\ -4 & 1 \end{vmatrix} = 2, \quad A_{22} = \begin{vmatrix} 1 & -1 \\ 5 & 1 \end{vmatrix} = 6, \quad A_{23} = -\begin{vmatrix} 1 & 2 \\ 5 & -4 \end{vmatrix} = 14,$$

$$A_{31} = \begin{vmatrix} 2 & -1 \\ 4 & -2 \end{vmatrix} = 0, \quad A_{32} = -\begin{vmatrix} 1 & -1 \\ 3 & -2 \end{vmatrix} = -1, \quad A_{33} = \begin{vmatrix} 1 & 2 \\ 3 & 4 \end{vmatrix} = -2,$$

所以 $A^{-1} = \frac{1}{|A|} A^* = \begin{pmatrix} -2 & 1 & 0 \\ -\frac{13}{2} & 3 & -\frac{1}{2} \\ -16 & 7 & -1 \end{pmatrix}.$

2. 设 A 是一个 n 阶矩阵, 并且存在正整数 k 使得 $A^k = O$. 证明: $E - A$ 可逆, 且

$$(E - A)^{-1} = E + A + \cdots + A^{k-1}.$$

证明 因

$$(E - A)(E + A + \cdots + A^{k-1}) = E + A + \cdots + A^{k-1} - A - A^2 - \cdots - A^{k-1} - A^k = E,$$

所以 $E - A$ 可逆, 且

$$(E - A)^{-1} = E + A + \cdots + A^{k-1}.$$

3. 设 $A = \begin{pmatrix} 1 & 0 & 1 \\ 0 & 2 & 0 \\ 1 & 0 & 1 \end{pmatrix}$, 且 $AB + E = A^2 + B$, 求矩阵 B .

解 由 $AB + E = A^2 + B$ 得到 $(A - E)B = A^2 - E = (A - E)(A + E)$,

因 $A - E = \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix}$ 满足 $|A - E| = -1 \neq 0$, 即 $A - E$ 可逆,

所以 $B = A + E = \begin{pmatrix} 2 & 0 & 1 \\ 0 & 3 & 0 \\ 1 & 0 & 2 \end{pmatrix}.$

4. 解下列矩阵方程

$$(1) \begin{pmatrix} 2 & 5 \\ 1 & 3 \end{pmatrix} X = \begin{pmatrix} 4 & -6 \\ 2 & 1 \end{pmatrix}; \quad (2) \begin{pmatrix} 1 & 4 \\ -1 & 2 \end{pmatrix} X \begin{pmatrix} 2 & 0 \\ -1 & 1 \end{pmatrix} = \begin{pmatrix} 3 & 1 \\ 0 & -1 \end{pmatrix}.$$

解 (1) 因为 $\begin{vmatrix} 2 & 5 \\ 1 & 3 \end{vmatrix} = 1 \neq 0$, 故 $\begin{pmatrix} 2 & 5 \\ 1 & 3 \end{pmatrix}$ 可逆. 因此

$$X = \begin{pmatrix} 2 & 5 \\ 1 & 3 \end{pmatrix}^{-1} \begin{pmatrix} 4 & -6 \\ 2 & 1 \end{pmatrix} = \begin{pmatrix} 3 & -5 \\ -1 & 2 \end{pmatrix} \begin{pmatrix} 4 & -6 \\ 2 & 1 \end{pmatrix} = \begin{pmatrix} 2 & -23 \\ 0 & 8 \end{pmatrix}.$$

(2) 经计算 $\begin{vmatrix} 1 & 4 \\ -1 & 2 \end{vmatrix} = 6 \neq 0$ 且 $\begin{vmatrix} 2 & 0 \\ -1 & 1 \end{vmatrix} = 2 \neq 0$, 故 $\begin{pmatrix} 1 & 4 \\ -1 & 2 \end{pmatrix}$ 和 $\begin{pmatrix} 2 & 0 \\ -1 & 1 \end{pmatrix}$ 可逆. 因此

$$\begin{aligned} X &= \begin{pmatrix} 1 & 4 \\ -1 & 2 \end{pmatrix}^{-1} \begin{pmatrix} 3 & 1 \\ 0 & -1 \end{pmatrix} \begin{pmatrix} 2 & 0 \\ -1 & 1 \end{pmatrix}^{-1} = \frac{1}{12} \begin{pmatrix} 2 & -4 \\ 1 & 1 \end{pmatrix} \begin{pmatrix} 3 & 1 \\ 0 & -1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 1 & 2 \end{pmatrix} \\ &= \frac{1}{12} \begin{pmatrix} 6 & 6 \\ 3 & 0 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 1 & 2 \end{pmatrix} = \begin{pmatrix} 1 & 1 \\ \frac{1}{4} & 0 \end{pmatrix}. \end{aligned}$$

5. 设 A 为三阶矩阵, $|A| = \frac{1}{2}$, 求 $|(2A)^{-1} - 5A^*|$.

解 因为 $A^{-1} = \frac{1}{|A|}A^*$, 所以

$$\begin{aligned} |(2A)^{-1} - 5A^*| &= \left| \frac{1}{2}A^{-1} - 5|A|A^{-1} \right| = \left| \frac{1}{2}A^{-1} - \frac{5}{2}A^{-1} \right| = |-2A^{-1}| = (-2)^3|A^{-1}| \\ &= -8|A|^{-1} = -16. \end{aligned}$$

6. 已知矩阵 A 的伴随矩阵 $A^* = \text{diag}(1, 1, 1, 8)$, 且 $ABA^{-1} = BA^{-1} + 3E$, 求矩阵 B .

解 因由 $A^* = \text{diag}(1, 1, 1, 8)$ 有 $|A^*| = 8$, $AA^* = |A|E$ 即 $|A||A^*| = |A|^4$, 于是 $|A| = 2$, $A = |A|(A^*)^{-1} = 2\text{diag}(1, 1, 1, \frac{1}{8}) = \text{diag}(2, 2, 2, \frac{1}{4})$, 又由 $ABA^{-1} = BA^{-1} + 3E$ 得到 $AB = B + 3A$, 即 $(A - E)B = 3A$, 而 $A - E = \text{diag}(1, 1, 1, -\frac{3}{4})$ 是可逆矩阵, 且 $(A - E)^{-1} = \text{diag}(1, 1, 1, -\frac{4}{3})$, 所以

$$B = 3(A - E)^{-1}A = 3 \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & -\frac{4}{3} \end{pmatrix} \begin{pmatrix} 2 & 0 & 0 & 0 \\ 0 & 2 & 0 & 0 \\ 0 & 0 & 2 & 0 \\ 0 & 0 & 0 & \frac{1}{4} \end{pmatrix} = \text{diag}(6, 6, 6, -1).$$

7. 设 $AP = P\Lambda$, 其中 $P = \begin{pmatrix} 1 & 1 & 1 \\ 1 & 0 & -2 \\ 1 & -1 & 1 \end{pmatrix}$, $\Lambda = \begin{pmatrix} -1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 5 \end{pmatrix}$, 求 $\varphi(A) = A^8(5E - 6A + A^2)$.

解 因 $|P| = \begin{vmatrix} 1 & 1 & 1 \\ 1 & 0 & -2 \\ 1 & -1 & 1 \end{vmatrix} = \begin{vmatrix} 1 & 1 & 3 \\ 1 & 0 & 0 \\ 1 & -1 & 3 \end{vmatrix} = -6 \neq 0$ 即矩阵 P 可逆, 且

$$P^{-1} = \begin{pmatrix} \frac{1}{3} & \frac{1}{3} & \frac{1}{3} \\ \frac{1}{2} & 0 & -\frac{1}{2} \\ \frac{1}{6} & -\frac{1}{3} & \frac{1}{6} \end{pmatrix},$$

于是由 $AP = P\Lambda$ 有 $A = P\Lambda P^{-1}$.

$$\begin{aligned}\varphi(A) &= P\Lambda^8(5E - 6\Lambda + \Lambda^2)P^{-1} = \begin{pmatrix} 1 & 1 & 1 \\ 1 & 0 & -2 \\ 1 & -1 & 1 \end{pmatrix} \begin{pmatrix} 12 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} \frac{1}{3} & \frac{1}{3} & \frac{1}{3} \\ \frac{1}{2} & 0 & -\frac{1}{2} \\ \frac{1}{6} & -\frac{1}{3} & \frac{1}{6} \end{pmatrix} \\ &= 4 \begin{pmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{pmatrix}.\end{aligned}$$

8. 设 A^* 为 n ($n > 1$) 阶矩阵 A 的伴随矩阵, 证明: (1) 若 $|A| = 0$, 则 $|A^*| = 0$; (2) $|A^*| = |A|^{n-1}$.

证明 A^* 为 n ($n > 1$) 阶矩阵 A 的伴随矩阵,

(1) 因 $AA^* = |A|E$, 若 $|A| = 0$, 则 $AA^* = O$,

假设 $|A^*| \neq 0$, 即 A^* 可逆, $A^*(A^*)^{-1} = E$,

则 $A = AE = AA^*(A^*)^{-1} = O$, 从而 A 的所有 $n-1$ 阶子式都为 O , 即 $A^* = O$, 这与 $|A^*| \neq 0$ 矛盾, 因此 $|A| = 0$ 时 $|A^*| = 0$;

(2) 如 $|A| \neq 0$, 由 (1) 知 $|A^*| \neq 0$, 则 $|A^*| = |A|^{n-1}$;

如 $|A| \neq 0$, 由 $AA^* = |A|E$ 有 $|A| \cdot |A^*| = |A|^n$, 故 $|A^*| = |A|^{n-1}$.
